Introduction

This document is an addendum to the *Remedial Investigation Water Column Monitoring/Small Volume Chemical Data Collection Quality Assurance Project Plan/Field Sampling Plan Addendum* dated July 2012 (AECOM 2012; hereafter referred to as the 2012 Water Column Monitoring QAPP) and includes that document by reference. This Quality Assurance Project Plan (QAPP) Addendum A outlines the Water Quality Monitoring Program associated with dredging and capping operations for the River Mile (RM) 10.9 Removal Action.

The RM 10.9 Removal Action operations (i.e., dredging and capping) may suspend sediments into the water column and may be measureable in the immediate and downstream river environment. Water quality monitoring will be conducted to identify any exceedance of trigger levels. Dredging Best Management Practices (BMPs) will be implemented during the RM 10.9 Removal Action as necessary to reduce the potential for river water quality impacts during the project.

Samples will be collected from within and in the vicinity of the RM 10.9 Removal Area, located in the Lower Passaic River Study Area (LPRSA). Associated Quality Assurance (QA) and Quality Control (QC) activities developed for this program have also been included in this 2013 Water Column Monitoring QAPP Addendum A.

Table 1 provides a key to the 2012 Water Column Monitoring QAPP and this Addendum and includes the following:

- Worksheets that are included by reference as written in the 2012 Water Column Monitoring QAPP (i.e., not revised for this addendum and not included in this addendum);
- Worksheets that are included by reference, but with changes (e.g., analysis of specific analytes) (only changes are included in this addendum); and,
- Worksheets that are revised and included in this addendum.

Background Information

The LPRSA encompasses the 17.4-mile tidal reach of the Passaic River below the Dundee Dam, its tributaries, and the surrounding watershed that hydrologically drains below the Dundee Dam. The RM 10.9 Study Area extends, bank to bank, between RM 10 and RM 12 of the LPRSA. The RM 10.9 Sediment Deposit Area, an area within the RM 10.9 Study Area, extends approximately 2,380 feet (ft), from RM 10.65 to RM 11.2. The RM 10.9 Removal Area (**Figure 1**) is an approximately 5.6-acre area located on the eastern side of the LPRSA within the RM 10.9 Sediment Deposit Area and extending to the northeast

In June 2012, the Cooperating Parties Group (CPG) signed an Administrative Order on Consent to perform the actions necessary to remove, treat, and/or properly dispose of approximately 20,000 cubic yards (yd^3) of sediment from the designated portion (i.e., the Removal Area) of the RM 10.9 Sediment Deposit Area due to elevated concentrations of polychlorinated dibenzo-p-dioxins/polychlorinated dibenzofurans (PCDDs/PCDFs), polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs), mercury, and other chemicals of potential concern (COPCs) and the potential for receptors to be exposed to them.

Sampling Objectives

Details regarding the sampling associated with the water quality monitoring activities are presented in the *Draft River Mile 10.9 Removal Action, Lower Passaic River Study Area, Water Quality Monitoring Plan* (herein referred to as the *RM 10.9 Water Quality Monitoring Plan*; CH2M HILL 2013). The objectives of the monitoring activities include the following:

- Monitor the water quality outside the silt curtains surrounding the dredge areas for increased resuspension during dredging operations
- Quantify select COPC concentrations in the water column during dredging operations
- Adjust operations as needed to achieve desired water quality during dredging

Sampling Approach

New Jersey Administrative Code (NJAC) 7:14A, Surface Water Discharge Criteria, and NJAC 7:9B, Surface Water Quality Standards, have been identified as relevant and appropriate requirements. The target COPCs are 2,3,7,8-TCDD, total PCB congeners, and mercury. While there are specific surface water effluent standards for these compounds at remediation sites, COPC sampling data cannot be collected and analysed in a suitable timeframe that will allow real-time management of dredging operations. Total suspended solids (TSS) (note that TSS is also referred to in this QAPP Addendum as suspended solids concentration [SSC]) and turbidity provide suitable parameters to assess potential construction-related water quality changes and were selected for water quality monitoring because they can be measured in real-time during the dredging/capping operations. Monitoring of COPCs will be conducted periodically.

Four stationary buoys to monitor turbidity were deployed on May 30-31, 2013 upstream and downstream of the RM 10.9 Removal Area to establish ambient non-dredging baseline conditions and to measure turbidity during dredging and capping operations. In addition, one mobile buoy will be used within the Removal Area to measure turbidity during dredging and capping operations. The locations of the five buoys are shown in Figure 1 and summarized below:

- Fixed Turbidity Buoy #1: Downstream "baseline" location at RM 10.2, approximately 0.5 miles (2,650 ft) downstream of the Removal Area's southern perimeter boundary
- Fixed Turbidity Buoy #2: Downstream location approximately 200 ft downstream of the RM 10.9 Removal Area's southern perimeter boundary
- Fixed Turbidity Buoy #3: Upstream location approximately 200 ft upstream of the RM 10.9 Removal Area's northern perimeter boundary
- Fixed Turbidity Buoy #4: Upstream "baseline" location at RM 11.7, approximately 0.5 miles (2,650 ft) upstream of the Removal Area's northern perimeter boundary
- Mobile Turbidity Buoy #5: This mobile operational buoy will be moved as needed to monitor turbidity within the Removal Area

At each buoy location, the turbidity monitors were placed at the approximate midpoint of the water column depth as measured at low tide (Buoy #1 – 5 ft below water surface, Buoy #2 – 5 ft, Buoy #3 – 5.5 ft, and

Buoy #4 – 7.0 ft). The farthest downstream and upstream monitoring sites (Buoys #1 and #4, respectively) are intended to reflect the ambient conditions of the river (depending on tidal and river stage conditions) and were placed such that they would not be affected by the dredging and capping operations. The monitoring sites adjacent to the Removal Area (Buoys #2 and #3) are intended to reflect conditions due to the dredging and capping operations. The fifth mobile monitoring location (Buoy #5) is intended to provide operational early detection of elevated turbidity levels and allow the project to make adjustments such that the trigger level is not exceeded.

The key sampling tasks are summarized below and presented in detail in the *RM 10.9 Water Quality Monitoring Plan*:

- Baseline Turbidity and TSS Monitoring (pre-dredging, June 2013): Data will be collected to support calculation of site-specific correlations for turbidity, TSS, and COPCs for the RM 10.9 Removal Action using both historical and project specific data. The baseline monitoring event will include surface water monitoring of turbidity (NTU) every 15 minutes for 30 days and collection of TSS samples over a 10-day period to verify and refine the historical turbidity–TSS correlation so that the real-time turbidity monitors can be used as the initial resuspension indicator.

  TSS samples will be collected for 10-days, targeting 3 different tidal periods (ebb, slack [high or low], and flood) each day. These samples will be collected at the four fixed buoy locations from two depths, surface (1 ft below water surface) and mid-depth (mid-point of the water column). Surface water grab samples will be collected along transects at each of the four fixed buoy locations, 3 locations per buoy (west, center, and east channel) and 2 depths (surface and mid-depth) to characterize TSS, particulate organic carbon (POC), dissolved organic carbon (DOC) and turbidity. Composite samples (comprising aliquots from the six transect locations) will also be collected for analysis of select COPCs (PCDDs/PCDFs, total PCB congeners, and mercury), POC, DOC, and TSS.

  In addition to verifying site-specific correlations, the baseline data will be used to identify any needed revisions to the current water quality monitoring program.

- Initial Dredging Monitoring (first 48 hours, July 2013): The turbidity–TSS correlation obtained from the baseline monitoring will be the starting point for the water quality monitoring program. This correlation will be updated as required during the initial dredging operations. During the first 48 hours of dredging, TSS samples will be collected at each of the four fixed buoy locations every 2 hours at surface and mid-depth over an 8-hour period each day. In addition, one composite sample (comprising individual samples collected every 2 hours) will be collected daily at each of the four fixed buoys for analysis of select COPCs (PCDDs/PCDFs, total PCB congeners, and mercury), POC, DOC, and TSS.

  During this initial phase of monitoring, a two-person crew in a small vessel (e.g., a jon boat) will monitor the for the presence of any visible turbidity plumes downstream of dredging activities using the same type of turbidity monitor used at the four fixed buoy locations. If a plume is observed, TSS samples will be collected from mid-depth. Sampling will start at the dredge and continue at fixed intervals in the direction of current flow within the center of the visible suspended solid plume until the downstream point is reached where turbidity levels return to approximately ambient levels. Surface water TSS sample/turbidity monitoring locations will be surveyed via GPS and recorded.

- Resuspension Monitoring: Once established, the correlation curve will be used to estimate the TSS concentration from the measured turbidity value, and turbidity will be measured continually during dredging operations at the five monitoring locations described earlier. Weekly synoptic (within same tidal cycle) transect sampling will also be conducted at each of the for fixed buoy locations (surface and mid-depth) for analysis of TSS, POC, and DOC in addition to a weekly composite sample to characterize select COPCs (PCDDs/PCDFs, total PCB congeners, and mercury), POC, DOC, and TSS.

  If a turbidity plume is observed, TSS samples will be collected as discussed in the Initial Dredging Monitoring task.

- Event-Based COPC Monitoring (exceedance of Turbidity Action Level): The purpose of this sampling is to collect surface waters if the Turbidity Action Level is exceeded. Sampling locations will be determined real-time based on the turbidity distribution pattern among the four fixed buoy locations. Samples will be analyzed for select COPCs (PCDDs/PCDFs, total PCB congeners, and mercury), POC, DOC, and TSS.

- Two (2) Liter Extraction for the PCDDs/PCDFs Analytical Fraction: The project may require lower detection limits for the PCDDs/PCDFs analytical fraction on specific sample groups. The use of a 2 liter volume extraction technique may be required of the laboratory in order to reach these lower detection limits for the target compounds. Sufficient notice will be given to the laboratory when these samples are to be collected and will be annotated accordingly on the COC document for identification purposes. The laboratory will adjust their detection limits on the final reports according to the extraction volume used in this procedure.

QAPP Worksheet #2 (UFP-QAPP Manual Section 2.2.4) QAPP Identifying Information

Site Name/Project Name: **Diamond Alkali Operable Unit (OU 2) – LPRRP RI/FS**

Site Location: **Lower Passaic River Study Area (LPRSA), New Jersey**
Site Number/Code : **CERCLA Document No. 02-2007-2009**
Operable Unit: **OU 2**
Contractor Name: **CH2M HILL**
Contractor Number: **Not Applicable (N/A)**
Contract Title: **N/A**
Work Assignment Number: **N/A**

1. Identify guidance used to prepare QAPP:

   Uniform Federal Policy for Quality Assurance Project Plans. Evaluating, Assessing, and Documenting Environmental Data Collection and Use Programs. Part 1: UFP-QAPP Manual. Final Version 1. March 2005. Intergovernmental Data Quality Task Force (US Environmental Protection Agency, US Department of Defense, US Department of Energy). USEPA 505-B-04-900A.

2. Identify regulatory program: Comprehensive Environmental Response Compensation, and Liability Act (CERCLA)

3. Identify approval entity: USEPA Region 2

4. Indicate whether the QAPP is a generic or a project-specific QAPP. (circle one)

5. List dates of scoping sessions that were held: May 23, 2013

6. List dates and titles of QAPP and FSP documents written for previous site work, if applicable:

The operations lead, in consultation with the CH2M HILL FTL, will follow guidelines documented in the site-specific Health and Safety Plan (HASP). In addition, standard safe boating practices related to weather conditions and vessel operations will apply, even if not specifically addressed in the HASP.
Analytical laboratory issues, including coordination with field, bench-scale treatability testing, schedule, and technical issues	CH2M HILL Project Chemist	Mark Stinnett	352.384.7180	Communicate with Laboratory PM as needed via phone or e-mail.
Nonconformances (field and/or laboratory)	CH2M HILL Data Validation Coordinator	Mark Stinnett	352.384.7180	Communicate with CH2M HILL PM, CH2M HILL Task Manager, and Laboratory PM as needed via phone or e-mail.
Audit findings (field and/or laboratory)	CH2M HILL Project QA Manager	Andrea DePoy	574.217.7035	Communicate findings to CH2M HILL Task Manager or Laboratory PM (as appropriate); transmit final audit reports, including corrective actions (CA), to CH2M HILL PM, CH2M HILL CWCM Task Manager, CPG Project Coordinator, and CPG QA Coordinator.
	CPG Project Coordinator	Robert Law/ Bill Potter/ Stan Kaczmarek (de maximis, inc.)	908.735.9315	CPG Project Coordinator will provide final audit reports to USEPA RPM.

Stop Work (technical non-compliance)	CH2M HILL Field team, Subcontractors, Project QA Manager, Project Chemists, and Data Management Task Manager			Any personnel believing that a work stoppage is necessary shall first verbally notify the CH2M HILL Task Manager or the CH2M HILL PM, who will in turn verbally notify de maximis, inc. and/or CH2M HILL QA Manager, if necessary. Given the potential significance of such communications, this will occur as quickly as possible.

QAPP Worksheet #7 (UFP-QAPP Manual Section 2.4.3) Personnel Responsibilities and Qualification Table

Name	Title	Organizational Affiliation	Responsibilities	Education and Experience Qualifications
Stan Kaczmarek	Field Coordinator for RM 10.9 Removal Action (Lead); CPG Project Coordinator (Alternate)	de maximis, inc.	Overall responsibility to coordinate all design, investigation, mobilization, construction and demobilization activities associated with the River Mile 10.9 Removal Action. Primary Point of Contact for the RM 10.9 Removal Action with the USEPA, its oversight contractor and the LPRSA Partner Agencies. Promote safe and proper execution of all field tasks. Periodically review and ensure contractors are implementing the approved design and enforcing project quality with their subcontractors. Also serves as back up for the Lead CPG Project Coordinator.	MS, Environmental Engineering, BS, Biological Sciences, 35 years experience
Robert Law	CPG Project Coordinator (Lead); Field Coordinator for RM 10.9 Removal Action (Alternate)	de maximis, Inc.	Overall responsibility for the safe and proper execution of task. Be available to discuss and review technical and other issues that may arise during work. Periodically review and audit work to ensure that work plan, project quality assurance/quality control (QA/QC), and Health and Safety (H&S) including both boating and hazardous materials worker safety procedures are being followed. All deviations from approved project plans will be discussed with and approved by the CPG Project Coordinator. Primary point of contact with the USEPA, its oversight contractor and the LPRSA Partner Agencies. Also serves as back up Field Coordinator for the RM 10.9 Removal Action.	PhD, Geology, 30 years experience

QAPP Worksheet #7 (UFP-QAPP Manual Section 2.4.3) Personnel Responsibilities and Qualification Table

Name	Title	Organizational Affiliation	Responsibilities	Education and Experience Qualifications
Willard Potter	CPG Project Coordinator (Alternate); Field Coordinator for RM 10.9 Removal Action (Alternate)	de maximis, Inc.	Serves as back up for the Lead CPG Project Coordinator. Responsible for the safe and proper execution of task. Be available to discuss and review technical and other issues that may arise during work. Periodically review and audit work to ensure that work plan, project QA/QC, and H&S including both boating and hazardous materials worker safety procedures are being followed. All deviations from approved project plans will be discussed with and approved by the CPG Project Coordinator. Primary point of contact with the USEPA, its oversight contractor and the LPRSA Partner Agencies. Also serves as back up Field Coordinator for the RM 10.9 Removal Action.	BS, Chemical Engineering, 42 years experience
Roger McCready	Project Manager	CH2M HILL	Overall responsibility for technical oversight of Removal Action tasks in accordance with SOW requirements including technical, financial, and scheduling. Primary point of contact for CH2M HILL with CPG Project Coordinator.	MS and BS, Geology, 24 years experience
James Brinkman	Design Manager	CH2M HILL	Responsible for technical oversight of Removal Action tasks in accordance with SOW requirements including technical, financial, and scheduling.	MS and BS, Chemical Engineering, over 25 years experience
Jennifer Wilkie	Task Manager	CH2M HILL	Responsible for the execution and completion of the scope of work identified in this addendum under the RM 10.9 Characterization program, including procurement of subcontractors, review of task deliverables, and serving as the focus for coordination of all field and laboratory tasks. The CH2M HILL Task Manager will keep the CH2M HILL PM apprised of the status of the task; as well communicate any issues with the schedule, budget, or achievement of the task objectives.	PhD, Civil and Environmental Engineering, MS and BS, Chemical Engineering, BS Biomedical Engineering, over 15 years experience

QAPP Worksheet #7 (UFP-QAPP Manual Section 2.4.3) Personnel Responsibilities and Qualification Table

Name	Title	Organizational Affiliation	Responsibilities	Education and Experience Qualifications
Andrea DePoy	Project QA Manager	CH2M HILL	Responsible for reviewing and approving QA procedures, ensuring that planned QA assessments (e.g., data validation) are conducted according to this QAPP Addendum and reporting on the adequacy of the QA Program to the CH2M HILL PM.	B.S.E., Geo-Environmental Engineering, 14 years experience
Jeffrey Hilgaertner	Regional EHS Manager	CH2M HILL	Responsible for ensuring that the objectives of CH2M HILL's Health and Safety Program are met and for monitoring task activities for conformance to the HASP.	BA, Business Management, over 20 years experience
Mark Stinnett	Project Chemist and Data Validation Coordinator	CH2M HILL	Responsible for laboratory procurement and monitoring of progress and will be the primary point of contact with the laboratories. The Project Chemist will also be responsible for communicating any issues that could affect achievement of the DQOs to the CH2M HILL Task Manager and the CH2M HILL Project QA Manager. Responsible for managing the validation task, including ensuring that validation is conducted and documented according to the requirements of this QAPP, and interacting with the laboratories to resolve any issues.	BS, Chemistry, 28 years experience
Andrew Watson	CH2M HILL FTL	CH2M HILL	Responsible for implementing field sampling activities in accordance with the approved plans QAPP, HASP and pertinent SOPs. Primary responsibilities will include directing activities on site, monitoring subcontractor performance in the field, reviewing field records, and communicating daily with the CH2M HILL PM regarding status, quality issues, or delays.	MS, Environmental Engineering BS, Environmental Systems Engineering, 6 years experience
Mark Kill	Data Management Task Manager	ddms, inc.	Responsible for data management for project, Including overall responsibility for database quality and structure, including graphical representation of data.	BA, Geography, 13 years experience

Comments/Decisions: During this call USEPA and NJDEP comments on the proposed RM 10.9 Water Quality Monitoring Plan were discussed. Points of discussion relevant to this QAPP Addendum A included the following:

- Additional pre-dredge monitoring and sampling: Agency participants indicated that the additional sampling they are recommending will allow them to determine optimal placement of the monitoring buoys during dredge operations and will be useful to inform future dredging actions. CPG highlighted the extensive amount of chemical and SSC data as well of several months of turbidity samples collected under previous water column monitoring studies in the vicinity of RM 10.2 that were consulted prior to recommending its monitoring plan, and that the additional samples that were requested are not likely to modify those conclusions.
- Lab analysis using 2 L samples for dioxin/furans: Agency participants indicated they wanted higher volume to decrease detection limits and lower the occurrence of J values. CPG responded that if the purpose is to determine if dredging increases the release of dioxin, then a larger volume is not necessary.

QAPP Worksheet #9 (UFP-QAPP Manual Section 2.5.1) Project Scoping Session Participants Sheet

- Synoptic sampling: Agency participants indicated that for purposes of the Removal Action, synoptic sampling does not require sampling at multiple stations at the exact same time, but requested that sampling from the multiple stations be conducted in reasonably close time frames. CPG suggested sampling within the same tide cycle for the synoptic sampling events; Agency participants agreed.

Upon completion of the discussion, the agency participants requested the following information, which was provided by the CPG in a followup technical memorandum and email to EPA dated May 28, 2013:

- Additional information on whether or not 2L sample volumes for dioxin/furans can be accommodated
- Turbidity data for June and July 2010 at RM 10.2, showing how it regularly exceeds 50 NTU
- River velocity data during summer month flows to help guide placement of the turbidity buoys

A revised Surface Water Quality Monitoring Plan was provided to the CPG by USEPA on May 31, 2013.

QAPP Worksheet #10 (UFP-QAPP Manual Section 2.5.2) Problem Definition

The problem to be addressed by the project:

The RM 10.9 Removal Action operations (i.e., dredging and capping) may suspend sediments into the water column and may be measureable in the immediate and downstream river environment. This water quality monitoring program will identify exceedance(s) of trigger levels and will facilitate response and management of such events, including investigation and mitigation measures. Data are needed to verify the existing turbidity-TSS-COPC correlations and determine any modifications to the current water quality monitoring plan.

QAPP Worksheet #11 (UFP-QAPP Manual Section 2.6.1) Project Quality Objectives/Systematic Planning Process Statements

Who will use the data?

CPG, CH2M HILL, and USEPA will use these data for water quality monitoring during the RM 10.9 Removal Action.

What will the data be used for?

The data will be used for the following purposes:

- Monitor the water quality outside the silt curtains for increased resuspension during dredging operations
- Quantify select COPC concentrations in the water column during dredging operations
- Adjust operations as needed to achieve desired water quality during dredging

QAPP Worksheet #11 (UFP-QAPP Manual Section 2.6.1) Project Quality Objectives/Systematic Planning Process Statements

Turbidity data from fixed turbidity monitors will be collected in addition to surface water grab and composite samples, which will be analyzed for a range of constituents, including:

- PCDDs/PCDFs
- Total PCB Congeners (PCB)
- Low-Level Mercury (total and dissolved)
- Particulate Organic Carbon (POC)
- Dissolved Organic Carbon (DOC)
- Suspended Solids Concentration (SSC) [Total Suspended Solids]

The following additional information will be recorded in the water quality database and considered as necessary in the evaluation of data:

- Date, time and location of sampling;
- Person who collected the sample;
- Tidal information;
- Local wind speed and direction;
- Rainfall; and
- Other non-project river activities.

How "good" do the data need to be in order to support the environmental decision?

- The data need to meet project action limits (PALs)) presented in Worksheet #15.
- The data need to be collected and analyzed in conformance with various USEPA Region 2 quality assurance guidance and manuals (http://www.epa.gov/region2/qa/documents.htm).

How much data are needed (number of samples for each analytical group, matrix, and concentration)?

To verify and refine the turbidity-TSS-COPC correlations, the baseline monitoring will include collection of grab, transect, and composite samples as summarized in Worksheet #20.

QAPP Worksheet #11 (UFP-QAPP Manual Section 2.6.1) Project Quality Objectives/Systematic Planning Process Statements

Where, when, and how should the data be collected/generated?

Four stationary buoys to monitor turbidity were deployed on May 30-31, 2013 upstream and downstream of the RM 10.9 Removal Area to establish ambient (non-dredging) baseline conditions and to measure turbidity during dredging and capping operations. In addition, one mobile buoy will be used within the Removal Area to measure turbidity during dredging and capping operations. The locations of the five buoys are shown in Figure 1 and summarized below:

- Fixed Turbidity Buoy #1: Downstream "baseline" location at RM 10.2, approximately 0.5 miles (2,650 ft) downstream of the Removal Area's southern perimeter boundary
- Fixed Turbidity Buoy #2: Downstream location approximately 200 ft downstream of the RM 10.9 Removal Area's southern perimeter boundary
- Fixed Turbidity Buoy #3: Upstream location approximately 200 ft upstream of the RM 10.9 Removal Area's northern perimeter boundary
- Fixed Turbidity Buoy #4: Upstream "baseline" location at RM 11.7, approximately 0.5 miles (2,650 ft) upstream of the Removal Area's northern perimeter boundary
- Mobile Turbidity Buoy #5: This mobile operational buoy will be moved as needed to monitor turbidity within the Removal Area

At each buoy location, the turbidity monitors were placed at the approximate midpoint of the water column depth as measured at low tide (Buoy #1 – 5 ft below water surface, Buoy #2 – 5 ft, Buoy #3 – 5.5 ft, and Buoy #4 – 7.0 ft). The farthest downstream and upstream monitoring sites (Buoys #1 and #4, respectively) are intended to reflect the ambient conditions of the river (depending on tidal and river stage conditions) and were placed such that they would not be affected by the dredging and capping operations. The monitoring sites adjacent to the Removal Area (Buoys #2 and #3) are intended to reflect conditions due to the dredging and capping operations. The fifth mobile monitoring location (Buoy #5) is intended to provide operational early detection of elevated turbidity levels and allow the project to make adjustments such that the trigger level is not exceeded. Data will be collected to characterize water quality over different tide cycles.

Who will collect and generate the data?

CH2M HILL and its subcontractors, working on behalf of the CPG, will provide the field sampling coordination and field personnel required to conduct the water quality monitoring and will also provide laboratory coordination and support.

QAPP Worksheet #11 (UFP-QAPP Manual Section 2.6.1) Project Quality Objectives/Systematic Planning Process Statements

How will the data be reported?

The data recording and notification system will involve the continuous downloading of turbidity results via telemetry to a central database. These results will then be uploaded to a website which may be viewed by authorized users. In the event that an exceedance of the trigger value is detected, or when equipment failure may be imminent (e.g. low battery), an alert is sent via SMS to the environmental team for actioning.

Samples which are collected will be delivered to the laboratories on the same day where feasible, in accordance with the QAPP. An expedited turnaround time will be requested from the laboratories at the time of sample delivery, however, given the many external dependencies and inability of the laboratory to commit to a minimum turnaround period on results, this period cannot be guaranteed and will be subject to continual review. Upon validation, the analytical results will be entered into the water quality database as specified by data submission requirements of the LPRSA RI/FS.

Turbidity measurements above the action value for turbidity whether attributable to the RM 10.9 Removal Action activities or not, will be reported to USEPA within two working days of the results becoming known. This reporting will also include the management (response) measures taken at the time and possible cause(s) when RM 10.9 Removal Action activities were not found to have contributed to the turbidity.

How will the data be archived?

Electronic data will be archived by ddms.

QAPP Worksheet #14 (UFP-QAPP Manual Section 2.8.1) Summary of Project Tasks

Sampling Tasks: The key sampling tasks are summarized below and presented in detail in the *RM 10.9 Water Quality Monitoring Plan*:

- Baseline Turbidity and TSS Monitoring (pre-dredging, June 2013): Correlations for turbidity, TSS, and COPCs will be established for the RM 10.9 Removal Action using both historical and project specific data. The baseline monitoring event will include surface water monitoring of turbidity (NTU) every 15 minutes for 30 days and collection of TSS samples over a 10-day period to verify and refine the historical turbidity–TSS correlation so that the real-time turbidity monitors can be used as the initial resuspension indicator.

  TSS samples will be collected for 10-days, targeting 3 different tidal periods (ebb, slack [high or low], and flood) each day. These samples will be collected at the four fixed buoy locations from two depths, surface (1 ft below water surface) and mid-depth (mid-point of the water column). Surface water grab samples will be collected along transects at each of the four fixed buoy locations, 3 locations per buoy (west, center, and east channel) and 2 depths (surface and mid-depth) to characterize TSS, particulate organic carbon (POC), dissolved organic carbon (DOC) and turbidity. Composite samples (comprising aliquots from the six transect locations) will also be collected for analysis of select COPCs (PCDDs/PCDFs, total PCB congeners, and mercury), POC, DOC, and TSS.

  In addition to verifying site-specific correlations, the baseline data will be used to identify any needed revisions to the current water quality monitoring program.

- Initial Dredging Monitoring (first 48 hours, July 2013): The turbidity–TSS correlation obtained from the baseline monitoring will be the starting point for the water quality monitoring program. This correlation will be updated as required during the initial dredging operations. During the first 48 hours of dredging, TSS samples will be collected at each of the four fixed buoy locations every 2 hours at surface and mid-depth over an 8-hour period each day. In addition, one composite sample (comprising individual samples collected every 2 hours) will be collected daily at each of the four fixed buoys for analysis of select COPCs (PCDDs/PCDFs, total PCB congeners, and mercury), POC, DOC, and TSS.

  During this initial phase of monitoring, a two-person crew in a small vessel (e.g., a Jon boat) will monitor the for the presence of any visible turbidity plumes downstream of dredging activities using the same type of turbidity monitor used at the four fixed buoy locations. If a plume is observed, TSS samples will be collected from mid-depth. Sampling will start at the dredge and continue at fixed intervals in the direction of current flow within the center of the visible suspended solid plume until the downstream point is reached where turbidity levels return to approximately ambient levels. Surface water TSS sample/turbidity monitoring locations will be surveyed via GPS and recorded.

- Resuspension Monitoring: Once established, the correlation curve will be used to estimate the TSS concentration from the measured turbidity value, and turbidity will be measured continually during dredging operations at the five monitoring locations described earlier. Weekly synoptic

QAPP Worksheet #14 (UFP-QAPP Manual Section 2.8.1) Summary of Project Tasks

(within same tidal cycle) transect sampling will also be conducted at each of the for fixed buoy locations (surface and mid-depth) for analysis of TSS, POC, and DOC in addition to a weekly composite sample to characterize select COPCs (PCDDs/PCDFs, total PCB congeners, and mercury), POC, DOC, and TSS.

If a turbidity plume is observed, TSS samples will be collected as discussed in the Initial Dredging Monitoring task.

- Event-Based COPC Monitoring (exceedance of Turbidity Action Level): The purpose of this sampling is to collect surface waters if the Turbidity Action Level is exceeded. Sampling locations will be determined real-time based on the turbidity distribution pattern among the four fixed buoy locations. Samples will be analyzed for select COPCs (PCDDs/PCDFs, total PCB congeners, and mercury), POC, DOC, and TSS.

Analysis Tasks: Turbidity data from fixed turbidity monitors will be collected in addition to surface water grab and composite samples, which will be analyzed for a range of constituents, including:

- PCDDs/PCDFs
- Total PCB Congeners (PCB)
- Low-Level Mercury (total and dissolved)
- Particulate Organic Carbon (POC)
- Dissolved Organic Carbon (DOC)
- Suspended Solids Concentration (SSC) [Total Suspended Solids]

The QAPP Addendum analytical parameters will be analyzed using the same methods, and by the same laboratories, as specified in the 2012 Water Column Monitoring QAPP.

Additional Data Collection Requirements

The following additional information will be recorded in the water quality database and considered as necessary in the evaluation of data:

- Date, time and location of sampling;

QAPP Worksheet #14 (UFP-QAPP Manual Section 2.8.1) Summary of Project Tasks

- Person who collected the sample;
- Tidal information;
- Local wind speed and direction;
- Rainfall; and
- Other non-project river activities.

Visual Observations
Observations for the presence of a visible turbid plume and/or a visible sheen will be conducted and recorded on an hourly basis during daylight hours.

Quality Control Tasks: QC samples have been defined for the field and laboratory efforts. Field QC samples are summarized on Worksheet #20; laboratory QC samples are summarized on Worksheet #28.

Data Management Tasks: The handling of records and data are summarized on Worksheet #29.

Documentation and Records: Project related records (field, sample transfer/chain of custody, laboratory) are summarized on Worksheet #29.

Assessment/Audit Tasks: Field and laboratory audits are scheduled in accordance with Worksheet #31.

Data Review Tasks: Field data will be reviewed as described in Worksheet #34. Laboratories are contractually required to verify all laboratory data including electronic data deliverables (EDDs) as summarized in Worksheet #34. Data validation and usability assessments will be conducted as detailed in Worksheets #35, 36, and 37.

QAPP Worksheet #15 (UFP-QAPP Manual Section 2.8.1) Data Quality Levels and Analytical Method Evaluation

Matrix: Water
Analytical Group: PCDDs/PCDFs

QAPP Worksheet #16 (UFP-QAPP Manual Section 2.8.2) Project Sch/Timeline Table

Activities	Organization	Dates (MM/DD/YY)		Deliverable	Deliverable Due Date
		Anticipated Date(s) of Initiation	Anticipated Date of Completion		
Project Status	de maximis, inc.	Monthly	Monthly	Progress report	15th of each month
Planning and Development of Study Objectives	de maximis, inc. / CH2M HILL	April 2013	June 2013	QAPP Addendum A for Water Quality Monitoring	July 1 2013
Baseline Sampling	de maximis,inc. / CH2M HILL	June 2013	June 2013	Laboratory-validated data to EPA weekly; Independently validated results to EPA monthly	Starting July 2013
Dredging and Capping Operations	CH2M HILL and Subcontractors	July 2013	September 2013	Noted in monthly progress report and Remedial Action Completion Report	15th of each month for monthly report
Collection of Samples During and After Dredging and Submission for Analysis	CH2M HILL	July 2013	November 2013	Sample submission to laboratories	At time of collection
Laboratory Analysis	CH2M HILL	July 2013	November 2013	Analytical data to CPG	30 days after collection.
Laboratory Analysis	de maximis, inc. / CH2M Hill	July 2013	November 2013	Laboratory-validated data to EPA weekly; Independently validated results to EPA monthly	Starting July 2013
Data Validation and Verification	CH2M HILL	Multiple events, ending in November 2013		Data validation reports (DVRs) with data delivery	Four weeks following receipt of final laboratory data
Preparation and Delivery of Remedial Action Completion Report and Sampling Report to USEPA	de maximis, inc. / CH2M HILL	November 2013	January 2014	Remedial Action Completion Report and Sampling Report	January 2014

QAPP Worksheet #17 (UFP-QAPP Manual Section 3.1.1) Sampling Design and Rationale

Describe and provide a rationale for choosing the sampling approach (e.g., grid system, biased statistical approach):

The proposed sampling locations are presented in Figure 1 for this work. Sampling locations were chosen to:

- Monitor the water quality outside the silt curtains for increased resuspension during dredging operations.
- Quantify select COPC concentrations in the water column during dredging operations
- Adjust operations as needed to achieve desired water quality during dredging.

Describe the sampling design and rationale in terms of what matrices will be sampled, what analytical groups will be analyzed and at what concentration levels, the sampling locations (including QC, critical, and background samples), the number of samples to be taken, and the sampling frequency (including seasonal considerations):

The target COPCs are 2,3,7,8 TCDD, Total PCB Congeners, and mercury. While there are specific surface water effluent standards for these compounds at remediation sites, COPC sampling data cannot be collected and analysed in a suitable timeframe that will allow real-time management of dredging operations. TSS and turbidity provide suitable parameters to assess potential construction-related water quality changes, and were selected for water quality monitoring because they can be measured in real-time during the dredging/capping operations. Monitoring of COPCs will be conducted periodically. However, should an exceedance of the action level occur, additional water column sampling will be conducted outside the area of influence of the dredging/capping operations.

To verify and refine the turbidity-TSS-COPC correlations, the baseline monitoring will include collection of grab, transect, and composite samples as summarized in Worksheet #20.

Four stationary buoys to monitor turbidity were installed on May 30-31, 2013 upstream and downstream of the RM 10.9 Removal Area to establish average non-dredging baseline conditions and to measure turbidity during dredging and capping operations. In addition, one mobile buoy will be used within the Removal Area to measure turbidity during dredging and capping operations. The locations of the five buoys are shown in Figure 1 and summarized below:

- Fixed Turbidity Buoy #1: Downstream “baseline” location at RM 10.2, approximately 0.5 miles (2,650 ft) downstream of the Removal Area’s southern perimeter boundary

QAPP Worksheet #17 (UFP-QAPP Manual Section 3.1.1) Sampling Design and Rationale

- Fixed Turbidity Buoy #2: Downstream location approximately 200 ft downstream of the RM 10.9 Removal Area's southern perimeter boundary
- Fixed Turbidity Buoy #3: Upstream location approximately 200 ft upstream of the RM 10.9 Removal Area's northern perimeter boundary
- Fixed Turbidity Buoy #4: Upstream "baseline" location at RM 11.7, approximately 0.5 miles (2,650 ft) upstream of the Removal Area's northern perimeter boundary
- Mobile Turbidity Buoy #5: This mobile operational buoy will be moved as needed to monitor turbidity within the Removal Area

At each buoy location, the turbidity monitors were placed at the approximate midpoint of the water column depth as measured at low tide (Buoy #1 – 5 ft below water surface, Buoy #2 – 5 ft, Buoy #3 – 5.5 ft, and Buoy #4 – 7.0 ft). The farthest downstream and upstream monitoring sites (Buoys #1 and #4, respectively) are intended to reflect the ambient conditions of the river (depending on tidal and river stage conditions) and were placed such that they would not be affected by the dredging and capping operations. The monitoring sites adjacent to the Removal Area (Buoys #2 and #3) are intended to reflect conditions due to the dredging and capping operations. The fifth mobile monitoring location (Buoy #5) is intended to provide operational early detection of elevated turbidity levels and allow the project to make adjustments such that the trigger level is not exceeded. Data will be collected to characterize water quality over different tide cycles.

QAPP Worksheet #18 (UFP-QAPP Manual Section 3.1.1) Sampling Locations and Methods/SOP Requirements Table

Sampling Location	Matrix	Depth Intervals	Analyses	Number of Samples per Depth Interval: Number per Flow or Tidal Stage	Sampling SOP Reference	Rationale for Sampling Location
Fixed Turbidity Buoy #1	Water	Two: 1 ft below surface Mid-depth	PCDDs/PCDFs, total PCB congeners, mercury, POC, DOC, and TSS	Number of Samples Varies Depending on Task: Slack (High and Low) Ebb Tide Flood Tide	LPR-FI-04 LPR-FI-05 LPR-FI-06	Downstream "baseline" location at RM 10.2, approximately 0.5 miles (2,650 ft) downstream of the Removal Area's southern perimeter boundary. Intended to reflect the ambient conditions of the river (depending on tidal and river stage conditions) and were placed such that they would not be affected by the dredging and capping operations
Fixed Turbidity Buoy #2						Downstream location approximately 200 ft downstream of the RM 10.9 Removal Area's southern perimeter boundary. Intended to reflect conditions due to the dredging and capping operations
Fixed Turbidity Buoy #3						Upstream location approximately 200 ft upstream of the RM 10.9 Removal Area's northern perimeter boundary. Intended to reflect conditions due to the dredging and capping operations
Fixed Turbidity Buoy #4						Upstream "baseline" location at RM 11.7, approximately 0.5 miles (2,650 ft) upstream of the Removal Area's northern perimeter boundary. Intended to reflect the ambient conditions of the river (depending on tidal and river stage conditions) and were placed such that they would not be affected by the dredging and capping operations

QAPP Worksheet #20 (UFP-QAPP Manual Section 3.1.1) Field Quality Control Sample Summary Table

Baseline Turbidity and TSS Monitoring (grab samples)

Matrix	Analytical Group	Conc. Level	Analytical and Preparation SOP Reference[a]	No. Samples	No. of Duplicates	No. of MS/MSD Sets	Total No. of Samples to Lab
Water	SSC	Low	C-17	240	12	0	252

Baseline Turbidity and TSS Monitoring (transects and composites)

Matrix	Analytical Group	Conc. Level	Analytical and Preparation SOP Reference[a]	No. Samples	No. of Duplicates	No. of MS/MSD Sets	Total No. of Samples to Lab
Water	PCDDs/PCDFs	Low	A-1	10	1	1	12
Water	PCBs (Homologs and Congeners)	Low	T-5, T-6	10	1	1	12

QAPP Worksheet #21 (UFP-QAPP Manual Section 3.1.2) Project Sampling SOP References Table

Reference Number	Title, Revision Date and/or Number	Originating Organization	Equipment Type	Modified for Project Work? (Y/N)	Comments
LPR-FI-04	Small Volume Surface Water Sampling/Chemical Data Collection, Rev. 3	CH2M HILL	Peristaltic pump, trigger-activated bottle sampler	Yes. Composite samples will be collected[1] Trigger-activated bottle sampler will not be used.	2012 Water Column Monitoring QAPP Appendix B
LPR-FI-05	Water Column Profiling, Rev. 2	CH2M HILL	Datasonde	Yes[2]	2012 Water Column Monitoring QAPP Appendix B

[1] The Fluorinated High Density Polyethylene carboy units to be utilized for composite sample collection purposes will undergo a two stage rinsing cycle to remove any potential contaminates that may exist in the individual containers as a result of the manufacturing process. The initial rinse cycle will consist of 1 gallon of over-the-counter distilled water used for a 3 minute agitated rinse period which is then captured as a waste water product. The second (final) rinse will follow with 2 liters of laboratory provided distilled water for a 2 minute agitated rinse. The final rinse may be captured as an equipment blank and submitted to the laboratory for analysis.

[2] The multiparameter datasonde with turbidity sensor (YSI^{TM}) will be deployed from buoys upstream and downstream of the RM 10.9 Removal Area to establish average non-dredging baseline conditions and to measuring turbidity during dredging. A Nexsens Technology SDL 500 submersible wireless telemetry data logger will provide real-time transmittal of turbidity results to a web-based central database.

QAPP Worksheet #22 (UFP-QAPP Manual Section 3.1.2) Field Equipment Calibration, Maintenance, Testing, and Inspection Table
